

# Monitor Arms

## Saves Desk Space

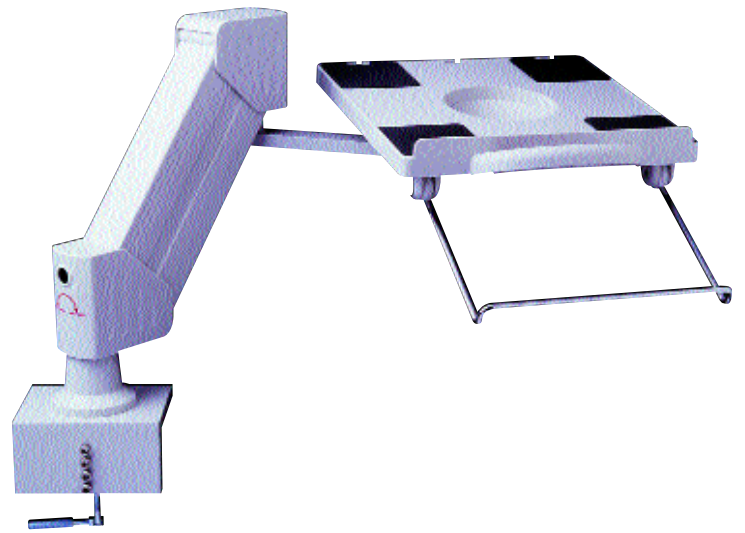

By getting the monitor and CPU off the desk, a great deal of space is freed up for productive work.

The Air Float Monitor Arm allows the user to lift the monitor off the desk, generating twice the normal work area that exists when the computer sits on the desk.

The Desktop Monitor Arm does not need to be bolted or attached to the desk and still frees up desk space.

## Minimizes Strain

Monitor positioning relative to the user is a fundamental part of good ergonomics. Computer users change their position frequently, so it's important that the monitor is kept at eye level, and is positioned in front of the user.
